

I feel that the FCC has not done enough testing to prevent interference to licensed users of the MF, HF, and lower VHF portions of spectrum. BPL will be disastrous to the spectrum and it will be impossible to keep hopping between frequencies to prevent such interference. BPL will be subject to propagation and has the ability to interfere with communications locally AND internationally. Other countries have scraped their BPL for good reasons... why haven't we? Physics isn't different in other countries. I speak as an informed person that is a multiple service user of the spectrum.
